## 1. Introduction

JAgraffe is a software made to ease fast email sending with attached pictures when you only want to show the recipient a scaled down version of the pictures. It allows to quickly find the best weight/size ratio for a set of resized pictures.

JAgraffe is particularly meant for **beginners** who do not always know how to correctly send by email all these nice *big pictures* coming from their 7M pixels brand new camera. Even for an **advanced user** who often send pictures by email, JAgraffe should save time.

## 2. General Principle

Using JAgraffe to send pictures by email is as simple as performing two consecutive drag and drop

- one from your file manager (where the original pictures are)
- then one from JAgraffe to the email window

Note that

- JAgraffe never modifies your pictures.
- JAgraffe never deletes your pictures
- JAgraffe should work with any email software that accepts drag and drop to attach documents to the email, on Linux (with JAVA 1.5+) and windows (with JAVA 1.4+)
- The users of email web interfaces can not use drag and drop to attach the pictures, but they can fetch the scaled down pictures in the temporary directory of JAgraffe

## 3. Contexte

JAgraffe is licensed under the terms of the liberal opensource [licence Apache 2.0](#) and was developed in JAVA by [Stephane Gallès](#). Source code is available in section [download](#).
